

CUP BASEPLATE

The new baseplate in the Hütter range

At the end of 2024, we released a new baseplate, complementing the standard baseplate for bitumen or PVC roofs. The "cup baseplate" features four larger openings for installation with tilt bolts. The advantage is that the cups hold the tilt bolts in place, preventing them from falling through the hole. The threaded rod no longer needs to be trimmed, making repositioning easier. The cups also allow for the use of concrete anchors.

The "cup baseplate" is made of stainless steel and is available from stock. If you have any questions about the baseplates or would like to discuss applications, please don't hesitate to contact us.
